

Programmed Feeder and Resin Cleaner for more efficient water conditioning resin and brine systems.

Res-Up Feeders

The most efficient water softener media are resin beads honeycombed with microscopic pores. As raw water passes through the medium impurities are deposited around the resin beads and in the pores. The brine bath removes the impurities but, alone, can't penetrate the pores or remove iron and slime deposits.

RES-UP CLEANER is formulated to penetrate bead pores and loosen up and float away iron and other impurities. Res-Up Cleaner will also keep softener components and control valve parts free of build-ups which impair proper functions.

RES-UP FEEDER is a programmed feeder which meters the proper amount of Res-Up Cleaner each time the resin bed is regenerated. The Res-Up Feeder can be programmed for the size of the resin bed and the amount of iron and impurities in the raw water.
